DEFINITIONS:

Area Source:	Those sources that emit less than 10 tons annually of a single hazardous air pollutant or less than 25 tons annually of a combination of hazardous air pollutants.
Minor	A source that is not major.
True Minor	Those sources that do not have the physical or operational capacity to emit major amounts (even if the source owner and regulatory agency disregard any enforceable limitations.
Synthetic Minor	Those sources that have the physical and operational capability to emit major amounts, but are not considered major sources because the owner or operator has accepted an enforceable limitation.
Title V Source	A major source has actual or potential emissions that meet or exceed the major source threshold. The major source threshold for any "criteria air pollutant" is 100 tons. Major source thresholds for "hazardous air pollutants" (HAP) are 10 tons/year for a single HAP or 25 tons/year for any combination of HAP.
Non-Title V	A minor source with enforceable limits on the source's potential emissions to maintain the source's minor operating permit status i.e. Synthetic Minor.
Major Source	Any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit considering controls, in the aggregate, 10 tons per year or more of any hazardous air pollutant or 25 tons per year or more of any combination of hazardous air pollutants. The Administrator may establish a lesser quantity, or in the case of radionuclides different criteria, for a major source than that specified in the previous sentence, on the basis of the potency of the air pollutant, persistence, potential for bioaccumulation, other characteristics of the air pollutant, or other relevant factors.
